Introduction

Printer Configurations can be configured in Jamf Pro settings and then deployed to managed Computers via a policy. The [Jamf Pro Administrators Guide](#) describes the process.

When you add a printer in the Jamf Pro console, you manually specify information about the printer, such as the CUPS name, device URI, and printer definition (CUPS PPD) file. **Jamf Printer Manager** simplifies the process by reading the settings for a printer that's already been configured in macOS and uploading its configuration details to Jamf Pro. These settings can then be adjusted within the Jamf Pro console as needed.

App Details

Cautions

Printer configurations are not automatically deployed to your Macs when uploaded. You will need to create a policy (Jamf Pro) to do so. Policies and profiles (Jamf School) should be scoped to test devices initially to verify functionality and compatibility prior to wider distribution.

License

MIT. Please see the LICENSE file in the project GitHub repository.

Copyright Notice

This document and the Printer Manger application are Copyright 2026, Jamf.

Privacy & Security

Minimal, anonymous usage analytics. The app sends a single anonymous "launched" signal to [TelemetryDeck](#) at startup, so the Concepts team can see adoption. No device, server, credentials, or Jamf object data is ever included. Opt out anytime by viewing About Jamf Printer Manager and check 'Opt out of analytics' (takes effect on next launch).

API credentials are optionally saved to your macOS user keychain.

Bill of Materials

Swift macOS app with no open-source or non-apple libraries.

App Details

Requires macOS 13.0 or later

App Sandbox - Enabled

Hardening - Enabled - Version 14.2.0

Notarization - Granted

Gatekeeper - Notarized Developer ID

Signed By - JAMF Software (483DWKW443)

Please do not use this software if you did not receive it from Jamf or if it's not signed by Jamf Software.

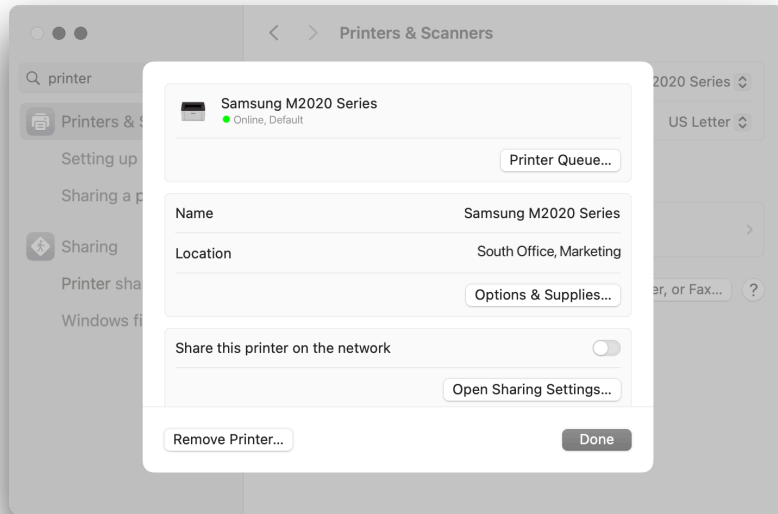

Checking signing from Terminal:

```
% spctl -a -vvv -t install /Applications/Jamf\ Printer\ Manager.app
/Applications/Jamf Printer Manager.app: accepted
source=Notarized Developer ID
origin=Developer ID Application: JAMF Software (483DWKW443)
```

Using Jamf Printer Manager

Configuring Printers

Using macOS System Settings, configure one or more printers on your Mac. Print something to ensure everything's working.

Credentials

Depending on the API you'll be interacting with you be required to enter credentials for a Jamf Pro Server. You can optionally save your server URL and login information to your keychain so you don't have to re-enter them the next time you use the program.

The API user or client will require the following permissions in Jamf Pro:

- **Printers** (Create, Read, Update, Delete)
- **Categories** (Read)

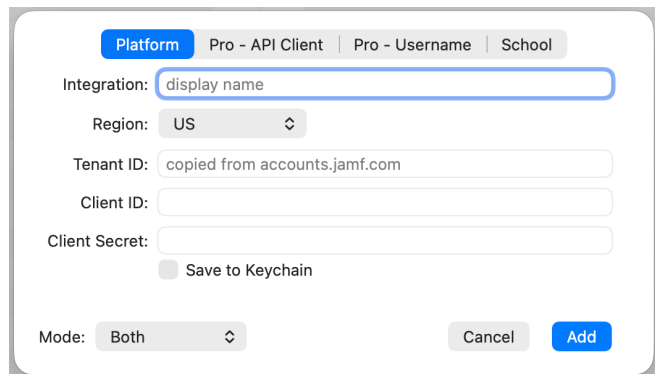

For information on creating a client ID and client secret see:

[Platform API](#)

[Jamf Pro API](#)

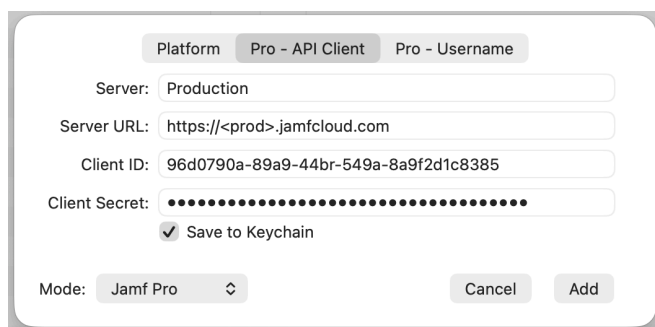

Launch Jamf Printer Manager

Open the Printer Manager application. Gatekeeper may ask for permission to “Open an app downloaded from the internet” on first run.

This screenshot shows the initial setup window for Jamf Printer Manager. At the top, there are four tabs: 'Platform' (selected), 'Pro - API Client', 'Pro - Username', and 'School'. Below the tabs, the 'Integration:' field contains 'display name'. The 'Region:' is set to 'US'. The 'Tenant ID:' field contains 'copied from accounts.jamf.com'. The 'Client ID:' and 'Client Secret:' fields are empty. There is a checkbox for 'Save to Keychain' which is currently unchecked. At the bottom left, the 'Mode:' is set to 'Both'. At the bottom right, there are 'Cancel' and 'Add' buttons.

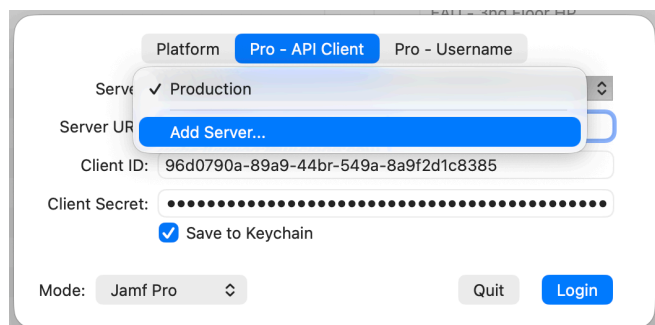

Note the mode button in the lower left. Use it to filter, if desired, which APIs are displayed and add a server.

This screenshot shows the same setup window, but the 'Mode:' has been changed to 'Jamf Pro'. The 'Server:' field now shows 'Production'. The 'Server URL:' field contains 'https://<prod>.jamfcloud.com'. The 'Client ID:' field contains '96d0790a-89a9-44br-549a-8a9f2d1c8385'. The 'Client Secret:' field is filled with dots. The 'Save to Keychain' checkbox is now checked. The 'Add' button is still present at the bottom right.

If asked to allow Jamf Printer Manager to find devices on the network selecting ‘Don’t Allow’ will not impact the apps functionality. Selecting ‘Allow’ will also have no impact on functionality.

Saved servers are listed in the Server drop-down menu on the login screen. The menu also has an “Add server...” option if you need to add more than one.

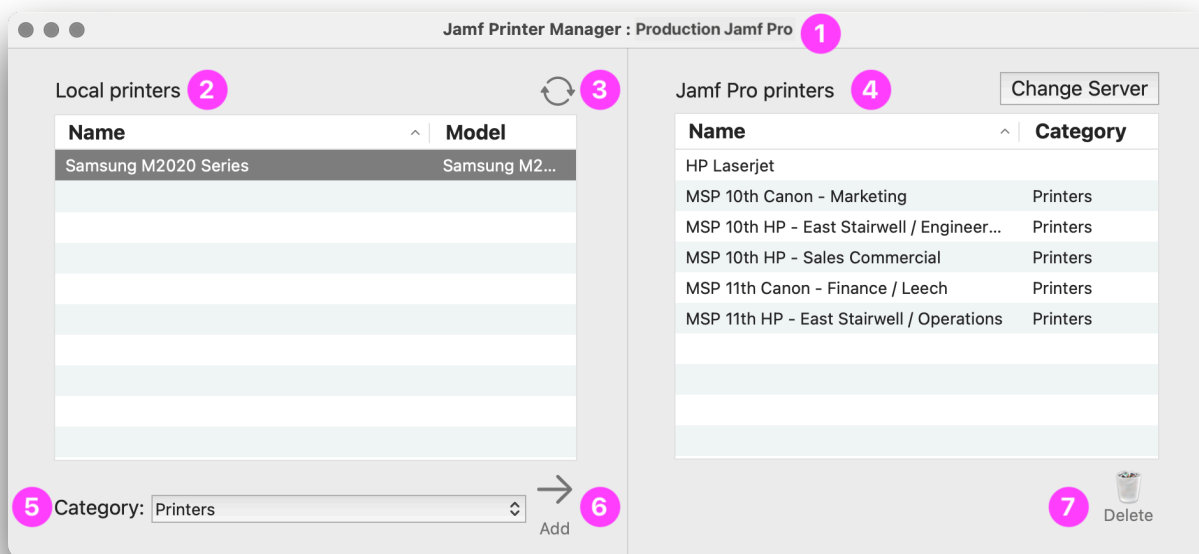

This screenshot shows the login screen of Jamf Printer Manager. The 'Platform' tab is selected. The 'Server:' dropdown menu is open, showing 'Production' with a checkmark and an 'Add Server...' button. The 'Server URL:' field is empty. The 'Client ID:' field contains '96d0790a-89a9-44br-549a-8a9f2d1c8385'. The 'Client Secret:' field is filled with dots. The 'Save to Keychain' checkbox is checked. At the bottom left, the 'Mode:' is set to 'Jamf Pro'. At the bottom right, there are 'Quit' and 'Login' buttons.

Adding and Editing Printers

Use the application to move local printer configurations to Jamf Pro:

- The application window title bar shows the currently connected Jamf Pro server **(1)**.
- A list of printers configured on the local Mac that are not already uploaded to Jamf Pro **(2)** is displayed on the left.
- If you configure or modify a printer in System Settings and want to reload the list, click the refresh button **(3)**.
- A list of printers configured in Jamf Pro on the right **(4)**.
- To upload a local printer to Jamf Pro, highlight it in the list and optionally, select a category from the drop-down list **(5)**, then click the Add button **(6)**.
- You may delete a printer from Jamf Pro by highlighting it in the list on the right and clicking the delete button **(7)**.

Double-clicking a printer in the Jamf Pro printer list (on the right) opens a window where you can make edits to the printer configuration. The printer setting fields are separated into General, Definition, and Limitations tabs. Click the Save button on the lower-right to save your changes and return to the printer list window.

Once you've uploaded your printer configuration(s) to Jamf Pro, log into the Jamf Pro console to create and scope a policy to deploy the printer. Further information may be found in the [Jamf Pro Administrator's Guide](#).

Troubleshooting notes

API calls

Endpoint	REST Operation	Privilege
{server}/api/oauth/token	POST	None
{server}/api/v1/auth/token	POST	None
https://{region}.api.jamfcloud.com/auth/token	POST	None
{server}/api/v1/auth/invalidate-token	POST	None
{server}/api/v1/jamf-pro-version	GET	None
.../printers*	GET	Printers - Read
.../printers/id/*	GET/POST/PUT/DELETE	Printers - Read/Create/Update/Delete
.../categories*	GET	Categories - Read

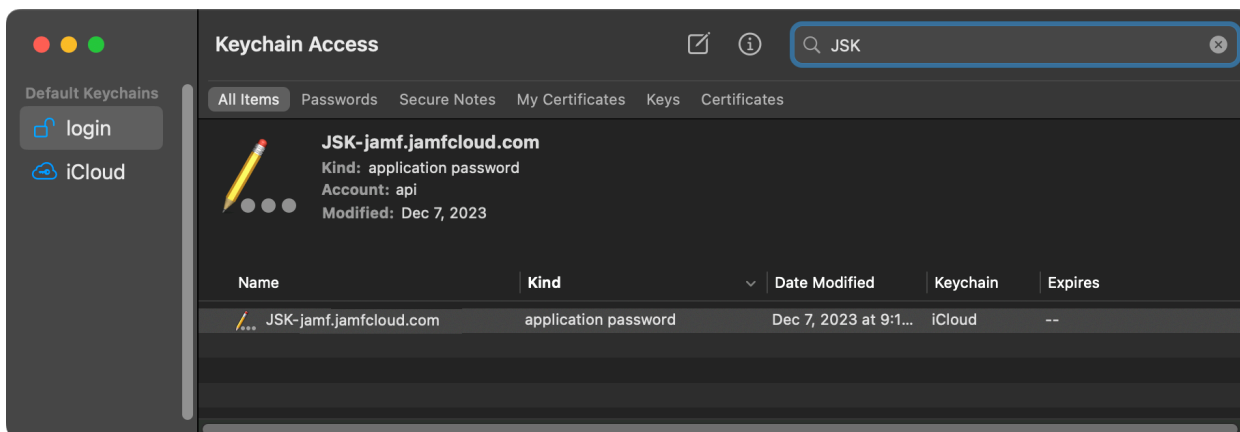

* Platform routes through https://{region}.api.jamfcloud.com/proclassic/; Pro API Client and Classic use {server}/JSSResource/

Application Logs

You can view the logs from within the app with the **View → Logs** menu item. The log file is located in the ~/Library/Containers/Jamf Printer Manager/Data/Library/Logs directory.

Login and Keychain Items

If you're having trouble logging into the app, check your hostname and credentials obviously. You can also try removing saved password information. Any Jamf Pro credentials you chose to save will have an entry in your Login keychain. The keychain item(s) will be named "JSK-<hostname of Jamf Pro instance>". You'll have one entry for each Jamf Pro server for which you've saved a password.

Data and Settings

Files created by the application are stored in:

`~/Library/Containers/com.jamf.ce.printermanager/Data` (Jamf Printer Manager)

The main preference file is:

`~/Library/Containers/com.jamf.ce.printermanager/Data/Library/Preferences/
com.jamf.ce.printermanager.plist`
