Introduction

Printer Configurations can be configured in Jamf School and then deployed to managed Computers via a profile. The [Jamf School Printer Management](#) documentation describes the process.

When you add a printer in the Jamf School console, you manually specify information about the printer, such as the device URI, display name, and printer definition (CUPS PPD) file. **Jamf Printer Manager** simplifies the process by reading the settings for a printer that's already been configured in macOS and creating a profile and PPD package. The profile and package can then be uploaded into Jamf School.

App Details

Cautions

Printer configurations are not automatically deployed to your Macs when uploaded. You will need to scope the profile. Profiles should be scoped to test devices initially to verify functionality and compatibility prior to wider distribution.

License

MIT. Please see the LICENSE file in the project GitHub repository.

Copyright Notice

This document and the Printer Manger application are Copyright 2026, Jamf.

Privacy & Security

Minimal, anonymous usage analytics. The app sends a single anonymous "launched" signal to [TelemetryDeck](#) at startup, so the Concepts team can see adoption. No device, server, credentials, or Jamf object data is ever included. Opt out anytime by viewing About Jamf Printer Manager and check 'Opt out of analytics' (takes effect on next launch).

API credentials are optionally saved to your macOS user keychain.

Bill of Materials

Swift macOS app with no open-source or non-apple libraries.

App Details

Requires macOS 13.0 or later

App Sandbox - Enabled

Hardening - Enabled - Version 14.2.0

Notarization - Granted

Gatekeeper - Notarized Developer ID

Signed By - JAMF Software (483DWKW443)

Please do not use this software if you did not receive it from Jamf or if it's not signed by Jamf Software.

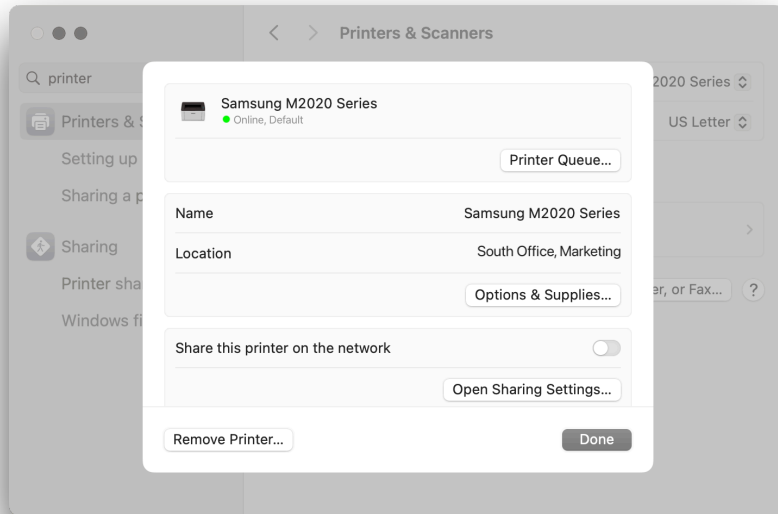

Checking signing from Terminal:

```
% spctl -a -vvv -t install /Applications/Jamf\ Printer\ Manager.app
/Applications/Jamf Printer Manager.app: accepted
source=Notarized Developer ID
origin=Developer ID Application: JAMF Software (483DWKW443)
```

Using Jamf Printer Manager

Configuring Printers

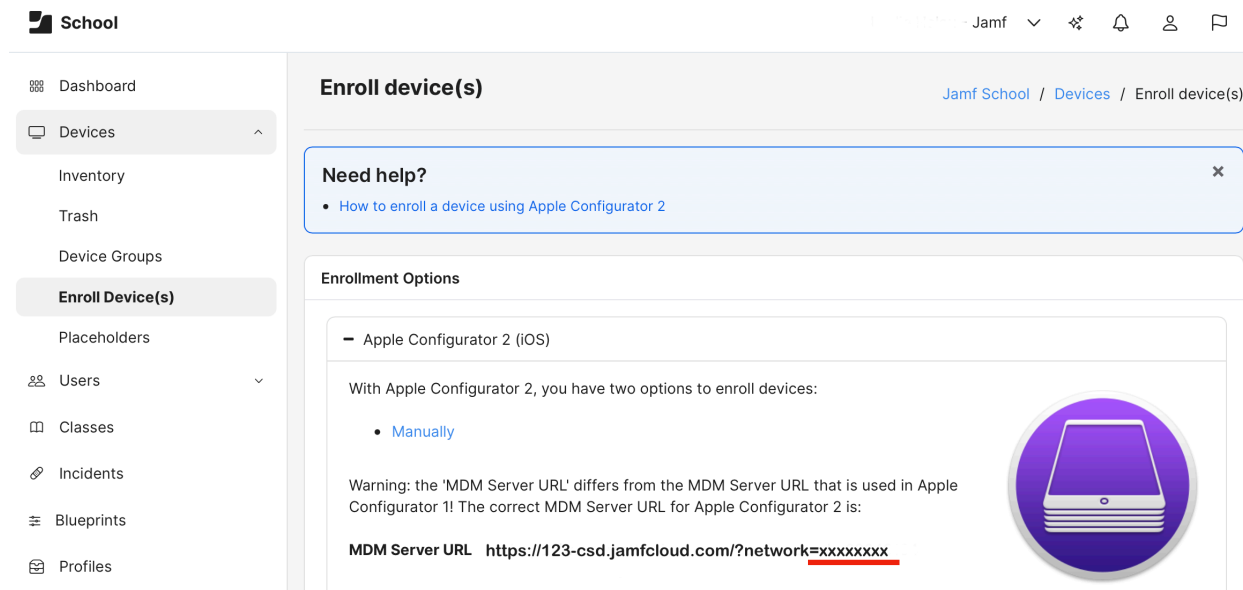

Using macOS System Settings, configure one or more printers on your Mac. Print something to ensure everything's working.

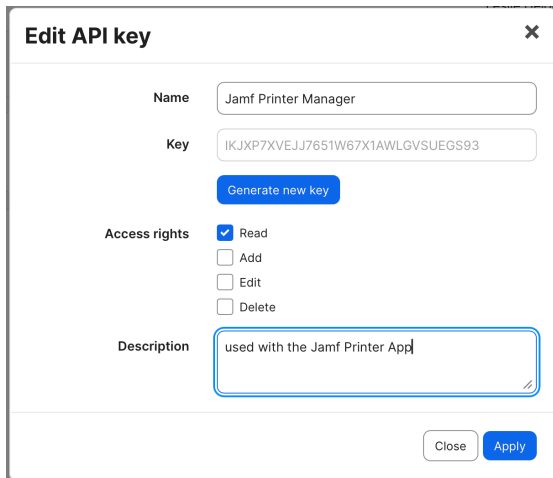

Credentials

- Jamf School requires a network ID and API key to access the API.

Your Network ID is listed in Devices > Enroll Device(s) > On-device enrollment (iOS & macOS) in Jamf School.

To create an API key navigate to Organization > Settings > API and click 'Add API Key'.

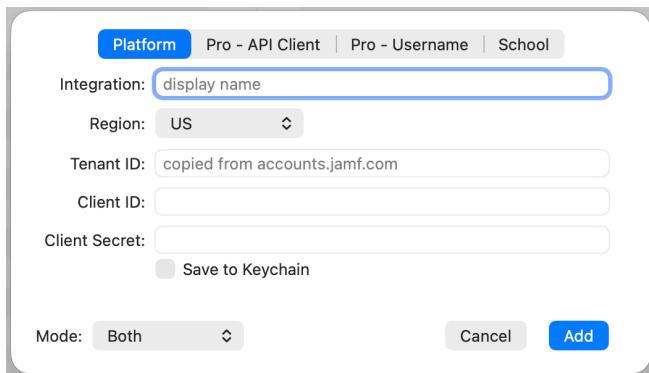

The 'Edit API key' dialog box contains the following fields and controls:

- Name:** Jamf Printer Manager
- Key:** IKJXP7XVEJJ7651W67X1AWLGVSGS93
- Generate new key:** A blue button.
- Access rights:** A list of checkboxes where 'Read' is checked, and 'Add', 'Edit', and 'Delete' are unchecked.
- Description:** A text field containing 'used with the Jamf Printer App'.
- Buttons:** 'Close' and 'Apply' buttons at the bottom right.

Only the Read access right is required.

Launch Jamf Printer Manager

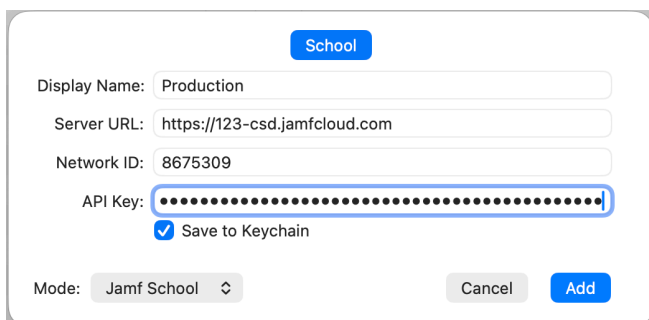

Open the Printer Manager application. Gatekeeper may ask for permission to “Open an app downloaded from the internet” on first run.

The integration setup screen includes the following elements:

- Tabs:** Platform (selected), Pro - API Client, Pro - Username, School.
- Integration:** display name
- Region:** US
- Tenant ID:** copied from accounts.jamf.com
- Client ID:** (empty field)
- Client Secret:** (empty field)
- Save to Keychain:** A checkbox.
- Mode:** Both
- Buttons:** Cancel and Add.

Note the mode button in the lower left. Use it to filter, is desired, which APIs are displayed and add a server.

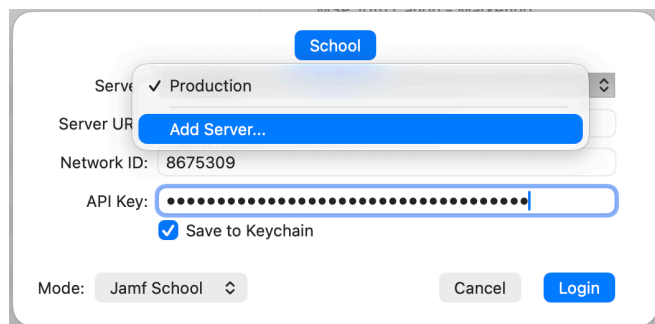

The integration setup screen with the 'School' tab selected includes the following elements:

- Tab:** School
- Display Name:** Production
- Server URL:** https://123-csd.jamfcloud.com
- Network ID:** 8675309
- API Key:** (masked field)
- Save to Keychain:** A checked checkbox.
- Mode:** Jamf School
- Buttons:** Cancel and Add.

If asked to allow Jamf Printer Manager to find devices on the network selecting 'Don't Allow' will not impact the apps functionality. Selecting 'Allow' will also have no impact on functionality.

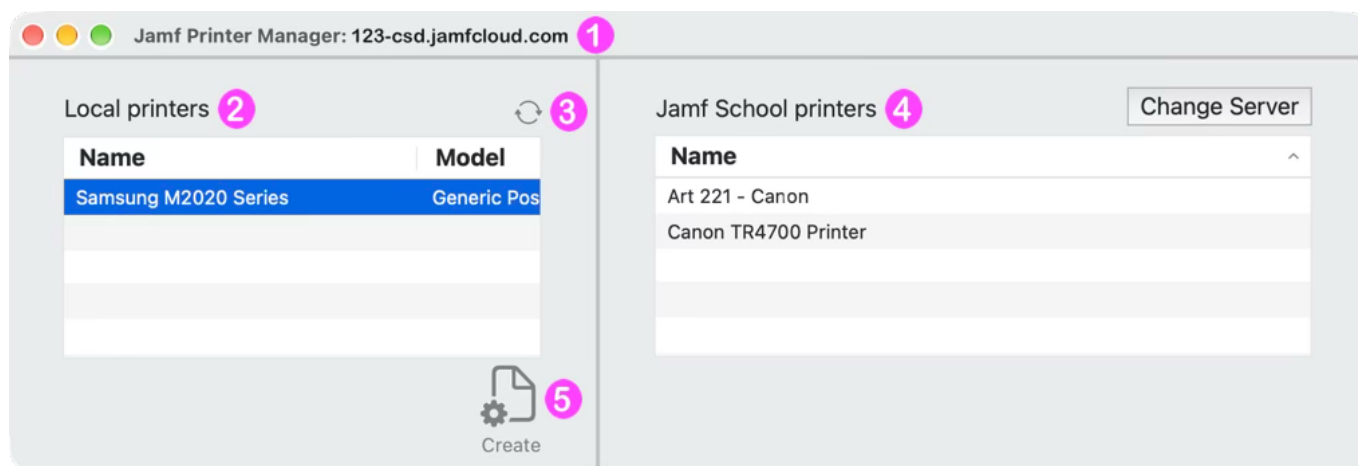

Saved servers are listed in the Server drop-down menu on the login screen. The menu also has an “Add server...” option if you need to add more than one.

The image shows the Jamf School login window. At the top, there's a blue button labeled 'School'. Below it, a dropdown menu shows 'Production' with a checkmark. To the right of the dropdown is an 'Add Server...' button. Below the dropdown, there are input fields for 'Server URL' (empty), 'Network ID' (containing '8675309'), and 'API Key' (filled with dots). A checkbox labeled 'Save to Keychain' is checked. At the bottom, there's a 'Mode' dropdown set to 'Jamf School', and 'Cancel' and 'Login' buttons.

Adding Printers

Use the application to create a profile and PPD package for use in Jamf School:

- The application window title bar shows the currently connected Jamf School server **(1)**.
- A list of printers configured on the local Mac **(2)** is displayed on the left.
- If you configure or modify a printer in System Settings and want to reload the list, click the refresh button **(3)**.
- A list of printers configured in Jamf School on the right **(4)**. The list is generated by looking for the word 'printer' in either the name or description of the profile as the API does not provide payload information. Substring matching occurs so 'printers', 'printing', ... anything that contains 'printer' will get picked up.
- To create the files used in Jamf School, highlight a printer in the list then click the Create button **(5)**.

- Edit, if desired, the display name and select the options appropriate for the printer deployment.

Display Name:

Samsung M2020 Series

Options:

☒ Allow user to modify printer list

☒ Allow printers that connect directly to user's computer

☐ Require an administrator password

☐ Only show managed printers

☐ Set as default

Footer Settings:

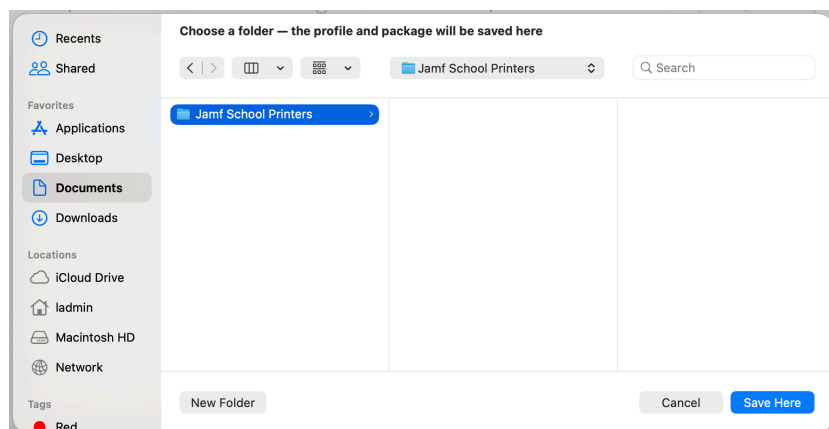

☐ Print page footer (user name and date)

Cancel

Create

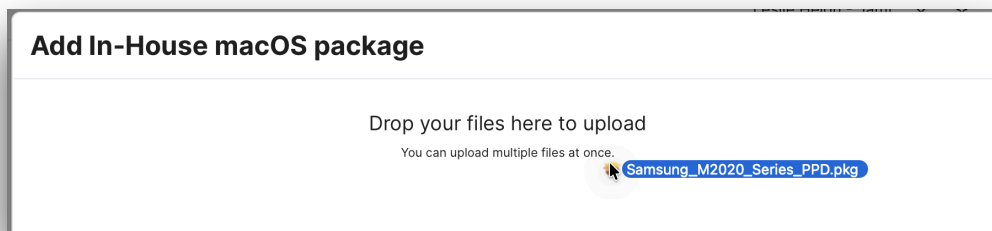

- Click 'Create' then select a location to save the mobileconfig and package files.

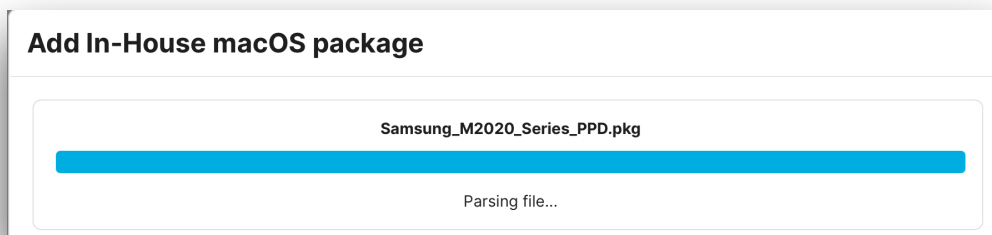

- Next we'll upload the files to Jamf School. Once logged in browse to Apps > Inventory and click 'Add App' and select 'Add In-House macOS Package'.

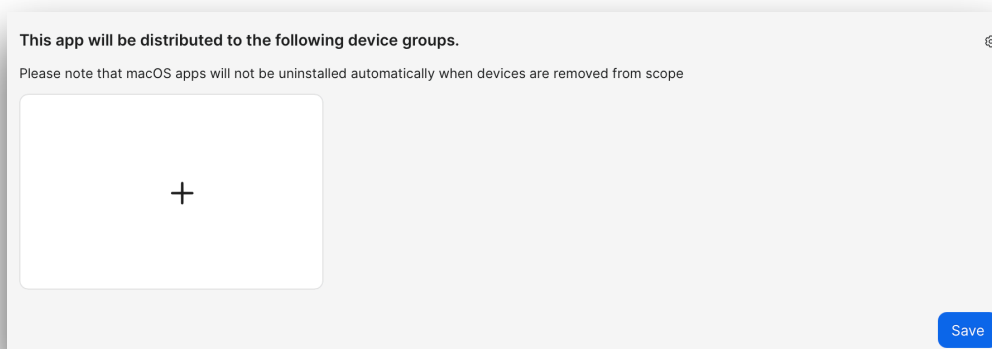

- Drag the package to upload.

- The upload should start automatically.

- (Optional) Set a scope for the package. Remember to first test the package on non-production devices before deploying to production devices. **Be sure to click 'Save'.**

- The mobileconfig file needs to be uploaded. Browse to Profiles and click 'Create Profile'. Select 'Upload custom profile'.

{server}/api/profiles/{id}	GET	Read

Application Logs

You can view the logs from within the app with the **View** → **Logs** menu item. The log file is located in the ~/Library/Containers/Jamf Printer Manager/Data/Library/Logs directory.

Login and Keychain Items

If you're having trouble logging into the app, check your hostname and credentials obviously. You can also try removing saved password information. Any Jamf School credentials you chose to save will have an entry in your Login keychain. The keychain item(s) will be named "JSK-<Jamf School instance>". You'll have one entry for each Jamf School server for which you've saved a password.

Data and Settings

Files created by the application are stored in:

~/Library/Containers/com.jamf.ce.printermanager/Data (Jamf Printer Manager)

The main preference file is:

~/Library/Containers/com.jamf.ce.printermanager/Data/Library/Preferences/
com.jamf.ce.printermanager.plist
